

SOV/120-59-1-40/50

The Behaviour of Some Types of Photomultipliers in a Weak Magnetic Field

solenoid. The resolution curve is shown dotted. At  $9 \pm 1$  oersted the total sensitivity increases by 10-15% while the best resolution is observed at 6 oersted. Experiments have shown that the changes indicated by Fig 1 are due mainly to the effect of the magnetic field on the electrons between the photocathode and the first dynode. The remaining part of the photomultiplier is practically independent of the effect of the magnetic field in the range 0-20 oersted. When the field is increased to 200 oersted the total sensitivity is reduced by a factor of 2. Figs 2 and 3 show identical curves for other photomultipliers while Fig 4 shows the effect of the magnetic field on the rise time for two different photomultipliers. Results have shown that the venetian blind section is the least sensitive to magnetic fields and the greatest magnetic field effects occur at the "input" of photo-

TITLE: Assembling of large log bundles in winter

SOURCE: Lesnaya promyshlennost', no. 9, 1965, 4-5

TOPIC TAGS: forest product, ~~packaging machinery, packaging technique~~, WOODWORKING  
MACHINERY / T-136 WOODWORKING MACHINERY 10

ABSTRACT: This article discusses the T-136 assembling device and describes the process of bundling logs as follows: after logs are graded, they are moved by conveyers to the assembly rack; from the rack, they roll down into a cradle where they are formed into a bundle and tied. Thereupon the log bundles are made into a raft and pulled by tugboat. The T-136 can handle 136 m<sup>3</sup> of lumber during a shift. Orig. art. has: 4 photographs.

PERIODICAL:

Nauka i zhizn', 1958, Nr 10, pp 33-41 (USSR)

ABSTRACT:

The editorial staff of this journal organized a meeting of scientists and practical workers of the agricultural field, directors of the VSKhV and representatives of the press. The meeting heard the following reports: Boris Nikolayevich Bogdanov, Director of the VSKhV, on the great importance of the All-Union agricultural exhibition; S.G. Skobkin, Chief Methodologist of the VSKhV, on the achievements of Soviet agricultural sciences as represented by the exhibition; S.G. Kolesnev, Academician of VASKhNIL, on problems of economy in the agricultural field; S.I. Zlobin, Krasnoyarsk kray, of the importance of the efficiency of labor for Siberia; F.N. Naumov, Head of the Krasnoshchekovski Rayon Executive Committee, on the complete utilization of Altay soil; M.I. Pulyayev, Director of the Sovkhoz "Rogachik", on the rapid development in cattle raising and the increase of agricultural produce; N.A. Chabanova, of the kolkhoz "Luch",

TITLE: Synthesis of optically active polymers on the basis of propylenediamine and  
cyclopropanedicarboxylic acid

SOURCE: Vysokomolekulyarnyye soedineniya, v. 6, no. 3, 1964, 512-515

TOPIC TAGS: polymer, optically active polymer, polyamide, cyclopropanedicarboxylic  
acid, propylene-1,2-diamine, interfacial polycondensation, dichloride of cyclopro-  
panedicarboxylic acid, turbidimetric titration

ABSTRACT: Synthesis of an optically active polymer from racemic components where  
the rate of incorporation of the D or L forms into the macromolecule differed was  
investigated. To 0.35 gm of racemic propylenediamine (in 400 ml water containing  
0.8 gm KOH, at room temperature and under energetic stirring) were added dropwise  
0.75 gm of the dichloride of trans-cyclopropanedicarboxylic-1,2 acid in 90 ml of  
chloroform. After standing 30 minutes the polyamide was separated by filtration,  
washed with 10% HCl and water, and purified by dissolution in 85% formic acid and

Card 1/2

ACCESSION NR: AP4030371

subsequent precipitation with ammonia. The synthesis of a polyamide from L-propylenediamine was conducted in a similar way. From this polyamide the cyclopropanedicarboxylic acid component was recovered by hydrolysis with phosphoric acid, treatment with barium hydroxide, and passage through a column containing the cationic resin KU-2. The recovered acid was found to be optically inert, while the polyamide itself displayed an optical rotation of a sign opposite to that of the original L-propylenediamine (its optical rotation dispersion curve being normal). It was also observed that the melting point of the optically active polymer was 40 to 50 degrees higher than that of the racemic polyamide. Orig. art. name: 1 formula and 3 charts.

TITLE: Accumulation of radioactive strontium in brown seaweed

SOURCE: Gigiyena i sanitariya, no. 12, 1966, 86-88

TOPIC TAGS: ~~YU~~ strontium, algae, sea water, *radioactive source*

ABSTRACT: The author investigated  $\text{Sr}^{89}$  accumulation in seaweed in the Barents Sea in order to understand the mechanism of the process. The experiments were carried out in transparent spherical aquariums of 500 l capacity, at 3-4°, 34.24% salinity, suspended in the Barents Sea bay. Sr in the amount of  $1.8 \cdot 10^{-8}$  Curie/l was thoroughly mixed with the water, and 24 hrs later 3 kl of algae (1 kl of each type) were added. Samples, each containing 4 g from 5 types of seaweed were removed after 12 hr, 1, 2, 4, 10, 13, and 17 days, placed in crucibles, dried, and burned in a furnace at 500°C. Simultaneously, 2 sea water samples (200 ml each) were also removed from the aquarium. Each sample included 100 mg of the carrier and was precipitated by  $\text{Sr}^{89}$  and Ca sulphates which were then separated by means of Trilon B (L. I. Afanas'yeva, *Zh. anal. Khim.*, 1960, Vol. 15). Specific activity of the seaweed ash contents and the sea water was determined by comparison with standard  $\text{Sr}^{89}$  preparations. Balanced  $\text{Sr}^{89}$  exchange in

UDC: 582.272-113.4:546.42.02.90

Card 1/2

ACC NR: AP7000689

*Fucus vesiculosus* et *serratus*, and *Ascophyllum nodosum* was realized in 5-7 days. The  $\text{Sr}^{89}$  elution rate ( $T/2$ ) was 6-8 hrs. Increase of stable  $\text{Sr}^{89}$  in sea water to 0.16 g/l decreased the  $\text{Sr}^{89}$  accumulation coefficient three-fold in *Fucus serratus*. Only further experimentation will demonstrate if the indicated  $\text{Sr}^{89}$  limits have reached the saturation point in the cellular substance. It does appear that higher  $\text{Sr}^{89}$  amounts produce precipitation of hydroxide in the sea water. Orig. art. has: 2 tables, 1 figure.

TITLE: Principles of constructing a digital correlator

SOURCE: AN UkrSSR. Kiberneticheskaya tekhnika (Cybernetic techniques). Kiev, Naukova dumka, 1965, 111-118

TOPIC TAGS: digital computer system, data correlation, special purpose computer, computer design, computer program

ABSTRACT: Although general principles have been relatively well established for the construction of the structure of specialized computers with program control, those computers which have a fixed program control require the development of a specific structure for each specific problem. The large variety of solvable problems leads to the creation of many varieties of fixed program control computers which vary in their structure and design. In view of this, in order to create a theory of the construction of such machines, it seems highly desirable to accumulate, analyze, and generalize the principles underlying the construction of specialized machines or computing devices. The present authors present fundamental

ACC NR: AT6017035

concepts on the construction of a computer for the calculation of the correlation function, i.e., a digital correlator. The question of the efficient separation of computing operations between the correlator and the computer is studied. The criteria in this case were the relative and the absolute work capacities of the computer on the one hand, and the quantity of equipment, and the dimensions and the complexity of the correlator on the other hand. The main characteristics of the digital correlator designed by the authors are given as follows: a binary system; a fixed point, the computed results have a whole and a fraction terms; the number of digits of the initial data fed in is 10, and the results of computation is 30; the operating frequency is 200 cps; the speed of response is 400 multiplications plus 400 additions per second; and the number of triodes is 860.  ABSTRACT : Work at the Department of Breeding in the Institute brought  
 out considerable variability in the local red-grained  
 spiked millet in regard to productivity and early ripening.  
 Individual selection for the best panicles made it possible  
 to determine the correlation between the weight of the grain  
 and the panicle with the weight of the panicle ( $r = +0.96$ )  
 and the number of grains to the panicle ( $r = +0.98$ ); be-  
 tween the weight of the grain from a panicle and the length  
 of the panicle ( $r = +0.74$ ); between the weight of the grain

TITLE: Curing of epoxide resins

SOURCE: Lakokrasochny\*ye materialy\* i ikh primeneniye, no. 3, 1964, 8-10

TOPIC TAGS: epoxide resin, phenyl glycidyl ether, carbanilide, epoxy group, imino group epoxide resin curing

ABSTRACT: It was established that phenyl glycidyl ether reacts with carbanilide to form hydroxyl-containing compounds as a result of the interaction between epoxy and imino groups; it was postulated that in addition, a reaction is possible between the epoxy groups and the hydroxyl groups formed. It was shown that condensation of butyl ether takes place in the course of the reaction of phenyl glycidyl ether with dibutyl ester of dimethylolurea, simultaneously with the interaction of the epoxy and imino groups, and with the interaction of the hydroxyl groups formed and the epoxy groups. This condensation is indicated by the evolution of butanol in the course of the reaction.
